6 QUICK STEPS · ABOUT 5 MINUTES OF YOUR TIME

Connecting your *new domain.*

Here's everything you need to do, start to finish, to get your domain pointed at your new website. No tech knowledge needed — just follow the pictures below in order.

1 Buy your domain

We'll send you a link with your domain name already picked out. Click it, create a free account if asked, and pay — your own card, your own account, you own it fully.

2 Message us the exact domain you bought

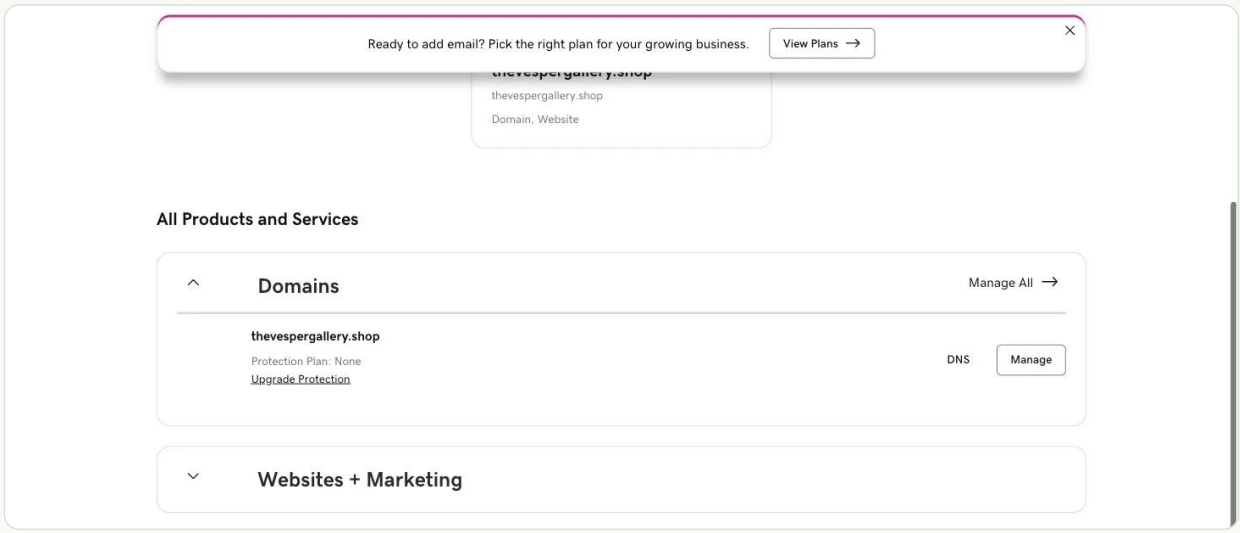

Just a quick text or email — e.g. "*Bought yourdomain.com!*" We need this to set our side up before sending you the next bit.

3 Wait for us to send you two short addresses

We'll get back to you with two web addresses (called "nameservers") — something like `xxxx.ns.cloudflare.com`. Usually same day. You'll need these for the next step.

4 Find your domain and click "DNS"

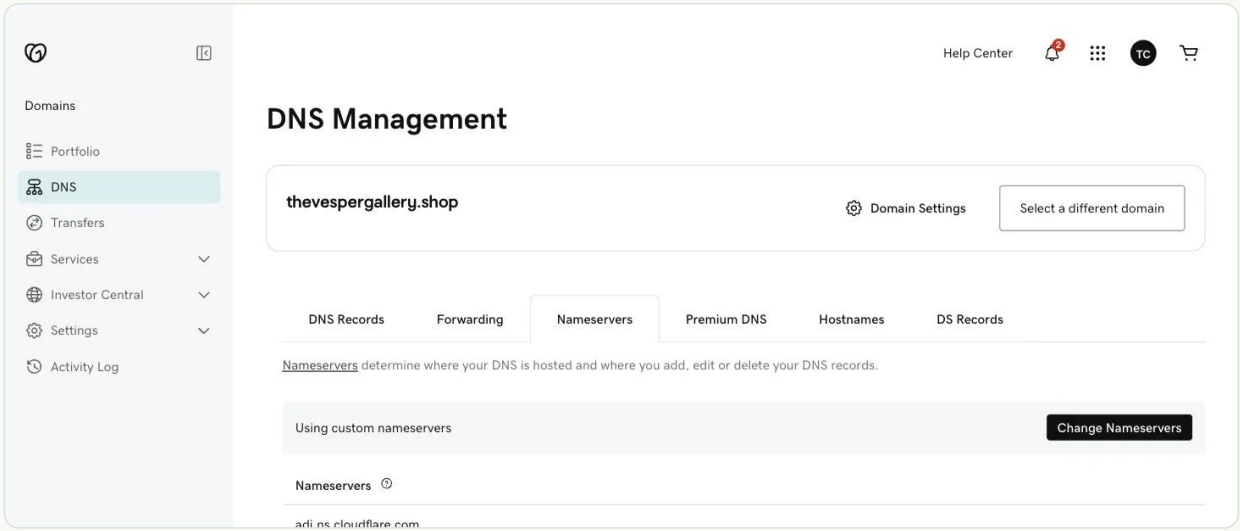

Sign into godaddy.com, then scroll to the Domains section of your products list. You'll see a "DNS" button next to your domain — click it.

Your domain in the products list — click the "DNS" button on the right

5 Click "Nameservers," then "Change Nameservers"

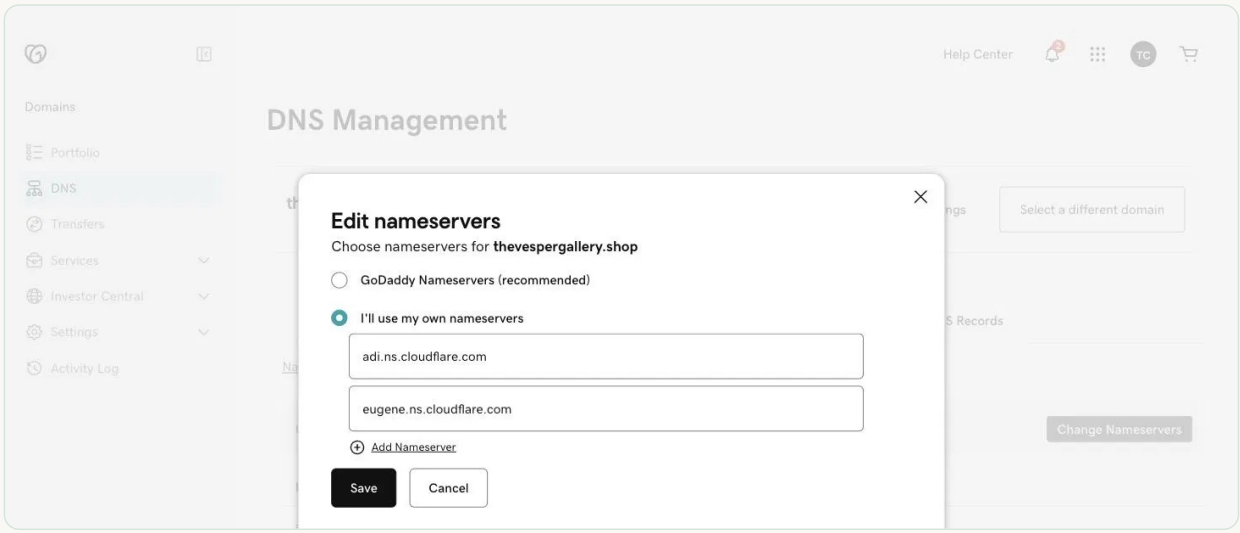

Along the top of the DNS Management page, click "Nameservers." Then click the black "Change Nameservers" button.

The Nameservers tab — click "Change Nameservers" here

6 Paste in the two addresses, save, and you're done

In the popup, choose "I'll use my own nameservers." Paste the first address into Nameserver 1, the second into Nameserver 2 — exactly as we sent them.

Both boxes filled in — the Save button lights up once they're correct

> **Important:** use whatever *we* send you, not the example shown above — every domain gets its own unique pair.

Click Save, then confirm on the popup that follows by clicking Continue. That's genuinely everything on your end.

> **What happens next:** it can take a few hours (sometimes up to a day) to fully switch over — that's completely normal. We'll message you the moment your new site is live on your domain.
